MOVIE ANALYTICS — KEY INSIGHTS

Executive summary of the trends and relationships identified from the TMDB 5000 Movie Dataset.

4,803	6.09	395.1B	139.5B	106.9 min
Total Movies	Average Rating	Total Revenue	Total Budget	Average Runtime

KEY INSIGHTS

01 Industry scale
The dataset contains **4,803 movies**, with an overall average audience rating of **6.09/10**. Recorded revenue totals about **395.1B**, compared with **139.5B** in budget.

02 Genre dominance
Drama is the most common genre tag, appearing in **2,297** movies, followed by Comedy and Thriller. Because movies can have multiple genre tags, genre counts represent genre assignments rather than mutually exclusive movie categories.

03 Release activity
Movie production activity peaked in **2009** with **247** releases. The dataset shows a pronounced increase in movie releases from the 1980s onward, with the strongest concentration in the 2000s and 2010s.

04 Budget and revenue
Budget and revenue have a **strong positive association (r ≈ 0.71)** among movies with non-zero budget and revenue. Higher investment is generally associated with higher revenue, although correlation does not imply that budget alone causes success.

05 Commercial leaders
Avatar leads the dataset with about **$2.79B** in revenue, followed by Titanic and The Avengers. A relatively small group of blockbuster movies drives a noticeable portion of total revenue.

06 Highly rated movies
Using a minimum threshold of **500 votes**, The Shawshank Redemption ranks highest at **8.5/10**, followed by The Godfather and Fight Club. Using vote count prevents movies with very few ratings from dominating the ranking.

07 Runtime relationships
Runtime has a **moderate positive association with rating (r ≈ 0.38)** but only a **weak positive association with revenue (r ≈ 0.23)**. This suggests that longer movies may receive somewhat higher ratings, but runtime alone is not a strong predictor of revenue.

RECENT 5-YEAR VIEW

Within the dataset's latest five calendar years (2013–2017), 2014 records the highest total revenue at approximately **$24.12B**. **2017** contains only one movie in this dataset and zero recorded revenue, so it should be treated as an **incomplete final year** rather than interpreted as a genuine industry decline.

Dashboard takeaway: Movie success is multifaceted. Genre popularity explains volume, audience votes support rating credibility, and budget is strongly associated with revenue — but no single factor guarantees a successful movie.
