HR Employee Attrition Analysis

Recommended Power BI Page Name: HR Employee Attrition Dashboard

1. Project Overview

This analysis examines employee demographics, departments, job roles, salary, experience, performance, satisfaction, overtime, work-life balance, and employee attrition. The objective is to identify the main factors associated with employees leaving the company and present the results through an interactive Power BI dashboard.

2. Dataset Overview

Metric	Result
Total Employees	1,470
Employees Who Left	237
Overall Attrition Rate	16.12%
Average Monthly Income	6,502.93
Average Age	36.9 years
Average Total Working Years	11.3 years

3. Key Findings

• **Department:** Sales has the highest attrition rate at approximately 20.6%, compared with about 13.8% in Research & Development.

• **Job Role:** Sales Representatives show the highest attrition rate at approximately 39.8%, making this role a major area of concern.

• **Overtime:** Employees working overtime have an attrition rate of approximately 30.5%, versus 10.4% for employees who do not work overtime.

• **Job Satisfaction:** Low job satisfaction is associated with higher attrition. Level 1 has approximately 22.8% attrition, compared with 11.3% for level 4.

• **Work-Life Balance:** Employees at the lowest work-life-balance level have approximately 31.2% attrition.

• **Performance:** Most employees have a Performance Rating of 3 (1,244 employees), while 226 employees have a rating of 4.

4. Recommended Power BI Dashboard

The dashboard should include KPI cards for Total Employees, Employees Left, Attrition Rate, and Average Monthly Income. Recommended visuals are Attrition Rate by Department, Job Role, Overtime, Job Satisfaction, and Work-Life Balance, plus Average Salary by Job Role. Useful slicers include Department, Job Role, OverTime, and Gender.

5. Conclusion

The analysis indicates that employee attrition is particularly associated with overtime, low job satisfaction, poor work-life balance, and specific job roles such as Sales Representative. These findings can help HR focus retention efforts on high-risk groups and investigate workload, employee satisfaction, and role-specific conditions.

Note: The analysis identifies associations in the dataset and does not establish causation.
